EXAM PAPERS

* Exam 1: Multivariable Calculus (Giải tích hàm nhiều biến - KHDL)

SAIGON UNIVERSITY

EXAM PAPER NO. 1

FINAL EXAMINATION

Course: Multivariable Calculus

Course Code: 858002

Duration: 90 minutes (not including time to distribute papers)

Semester: II ..... Academic Year: 2025 – 2026 .....
Training Level: Undergraduate ..... Training Form: Full-time .....
Student Name: ..... Student ID: .....

Students **CANNOT** use materials. Invigilators provide no further explanations.

Problem 1. (5.0 points) a) Given the function $u(x, y) = (x + y)\sqrt{x^2 + y^2}$. Prove that:

$$x\frac{\partial u}{\partial x} + y\frac{\partial u}{\partial y} = 2u \quad \text{for all } (x, y) \neq (0, 0).$$

b) Find the extrema of the function: $z = (x + y)^2 - \frac{x^4}{2} - \frac{y^4}{2}$.

c) Find the extrema of the function: $z = 20x^{\frac{1}{4}}y^{\frac{3}{4}}$, subject to the constraint $x+3y = 8$ $(x, y > 0)$.

Problem 2. (3.0 points) a) Calculate the area of the plane region D bounded by the curves

$$y = \frac{1}{x};\ y = \frac{5}{x};\ x = y^2 \text{ and } x = 5y^2.$$

b) The population density of a city is given by the function $f(x, y) = 20000e^{\frac{-(x^2+y^2)}{5}}$, calculated on the coordinate plane Oxy with the origin as the city center (unit: people/km^2). Calculate the population of the city in the region with a radius of 5 km from the city center. What is the average population density of this region?

Problem 3. (1.0 point) In the space $\mathbb{R}^3$, consider the object:

$$\Omega = \left\{(x, y, z) \in \mathbb{R}^3 : \sqrt{x^2 + y^2} \leq z \leq 4 - \sqrt{x^2 + y^2}\right\}$$

with mass density distribution given by the function $\rho(x, y, z) = x^2 + y^2$. Calculate the mass of Ω.

Problem 4. (1.0 point) Calculate the line integral

$$I = \int_\gamma (5y - 6^x)dx + (10x + 6^y)dy,$$

where γ is the circle $x^2 + y^2 = 36$.

* Exam 2: Abstract Algebra (Đại số đại cương)

SAIGON UNIVERSITY

EXAM PAPER NO. 2

FINAL EXAMINATION

Course: Abstract Algebra

Course Code: 801022

Duration: 90 minutes (not including time to distribute papers)

Semester: II ..... Academic Year: 2025 – 2026 .....

Training Level: Undergraduate ..... Training Form: Full-time .....

Student Name: ..... Student ID: .....

*Students **CANNOT** use materials. Invigilators provide no further explanations.*

Problem 1. (3.0 points) On the set $\mathbb{Z}$ of integers, define the operation $(*)$ as follows:

$$a * b = a + b + 2026 \quad \text{for all } a, b \in \mathbb{Z}.$$

a) Prove that the set $\mathbb{Z}$ together with the operation $(*)$ forms a group.

b) Is the set $X = \{4k + 2 \mid k \in \mathbb{Z}\}$ a subgroup of the group $(\mathbb{Z}, *)$? Justify your answer.

Problem 2. (1.5 points) Let $X = \langle x \rangle_m$ be a multiplicative cyclic group of order m generated by x, and $Y = \langle y \rangle_n$ be a multiplicative cyclic group of order n generated by y. Prove that the rule $\varphi : X \to Y; x^l \mapsto (y^k)^l$ $(k \in \mathbb{N}^*)$ is a homomorphism when km is divisible by n.

Problem 3. (2.0 points) Consider the set $\mathbb{Z}(\sqrt{2}) = \{a + b\sqrt{2} \mid a, b \in \mathbb{Z}\}$.

a) Prove that $\mathbb{Z}(\sqrt{2})$ is a ring with the usual addition and multiplication of real numbers.

b) Is the ring $\mathbb{Z}(\sqrt{2})$ a field? Justify your answer.

Problem 4. (1.5 points)

a) State the definitions of a field and an integral domain.

b) Prove that every field is an integral domain.

c) For $n > 1$, is the ring $\mathbb{Z}^n$ an integral domain? Justify your answer.

Problem 5. (2.0 points)

a) Use Eisenstein's criterion to prove that the polynomial $x^3 - 3x + 1$ is irreducible in $\mathbb{Q}[x]$.

b) In the ring $\mathbb{Z}_7[x]$, consider the polynomials $f = x^3 + \overline{p}x + \overline{5}$ and $g = x^2 + \overline{5}x + \overline{6}$. Determine p such that f is divisible by g.

* Exam 3: Functional Analysis (Giải tích hàm)

SAIGON UNIVERSITY

EXAM PAPER NO. 3

FINAL EXAMINATION

Course: Functional Analysis

Course Code: 801047

Semester: II.....

Training Level: Undergraduate .....

Duration: 90 minutes (not including time to distribute papers)

Student Name:.....

Academic Year: 2025-2026.....

Training Form: Full-time .....

Student ID:.....

Students **CANNOT** use materials. Invigilators provide no further explanations.

Problem 1 (3.0 points). On the vector space $\mathbb{R}^2$, define $\|(x,y)\| := 2|x| + |y|$ for all $(x,y) \in \mathbb{R}^2$.

(a) Prove that $\|\cdot\|$ is a norm on $\mathbb{R}^2$.

(b) Describe and draw a diagram of the closed unit ball $\overline{B(0,1)}$ in the normed vector space $(\mathbb{R}^2, \|\cdot\|)$.

Problem 2 (3.0 points). Let $X = C([0,1])$ be the space of continuous mappings $f : [0,1] \to \mathbb{R}$. For each $f \in X$, define $\|f\| = \max_{t\in[0,1]} |f(t)|$. Consider the mapping $T : X \to X$ given by $(Tf)(x) = x \int_0^1 y^2 f(y)dy$.

(a) Prove that T is a continuous linear mapping on X.

(b) Find $\|T\|_{B(X,X)}$, where $B(X,X)$ is the space of continuous linear mappings from X to X.

Problem 3 (3.0 points). Consider the space $\mathbb{R}^4$ with the Euclidean norm $\|(x_1,x_2,x_3,x_4)\| = \sqrt{x_1^2 + x_2^2 + x_3^2 + x_4^2}$ for all $x = (x_1,x_2,x_3,x_4) \in \mathbb{R}^4$. Let $M = \{(x_1,x_2,x_3,x_4) \in \mathbb{R}^4 : x_1 - x_2 = 0, x_2 - 2x_3 = 0, x_3 + x_4 = 0\}$ and the functional $f : M \to \mathbb{R}$ defined by $f(x_1,x_2,x_3,x_4) = x_1 + x_2 - x_3 + 2x_4$ for all $x \in M$.

(a) Prove that f is a continuous linear functional on M.

(b) Prove that there exists a continuous linear functional $F : \mathbb{R}^4 \to \mathbb{R}$ such that $F|_M = f$ and $\|F\|_{B(\mathbb{R}^4,\mathbb{R})} = \|f\|_{B(M,\mathbb{R})}$. Find the explicit formula of the operator F.

Problem 4 (1.0 point). Consider the Hilbert space $H = L^2([-1,1])$ with the inner product $\langle f,g\rangle = \int_{-1}^1 f(x)g(x)dx$. Let M_e and M_o denote the sets of even and odd functions in H, respectively.

(a) Prove that M_e and M_o are two mutually orthogonal subspaces of H.

(b) Consider the function $f(x) = x^3 + 3x^2 - 2x + 1$. Find the orthogonal projection of f onto the subspace M_o and calculate the distance from f to M_o.

- END -

SOLUTIONS

* Solutions: Exam 1 - Multivariable Calculus

Problem 1a: Partial Derivatives and Euler's Theorem

Solution. Given: $u(x, y) = (x + y)\sqrt{x^2 + y^2}$
We need to prove: $x\frac{\partial u}{\partial x} + y\frac{\partial u}{\partial y} = 2u$
Step 1: Calculate $\frac{\partial u}{\partial x}$

$$\frac{\partial u}{\partial x} = \sqrt{x^2 + y^2} + (x + y) \cdot \frac{x}{\sqrt{x^2 + y^2}}$$
$$= \frac{x^2 + y^2 + x(x + y)}{\sqrt{x^2 + y^2}} = \frac{2x^2 + y^2 + xy}{\sqrt{x^2 + y^2}}$$

Step 2: Calculate $\frac{\partial u}{\partial y}$

$$\frac{\partial u}{\partial y} = \sqrt{x^2 + y^2} + (x + y) \cdot \frac{y}{\sqrt{x^2 + y^2}}$$
$$= \frac{x^2 + y^2 + y(x + y)}{\sqrt{x^2 + y^2}} = \frac{x^2 + 2y^2 + xy}{\sqrt{x^2 + y^2}}$$

Step 3: Verify the relation

$$x\frac{\partial u}{\partial x} + y\frac{\partial u}{\partial y} = \frac{x(2x^2 + y^2 + xy) + y(x^2 + 2y^2 + xy)}{\sqrt{x^2 + y^2}}$$
$$= \frac{2x^3 + xy^2 + x^2y + x^2y + 2y^3 + xy^2}{\sqrt{x^2 + y^2}}$$
$$= \frac{2x^3 + 2xy^2 + 2x^2y + 2y^3}{\sqrt{x^2 + y^2}} = \frac{2(x^3 + xy^2 + x^2y + y^3)}{\sqrt{x^2 + y^2}}$$
$$= 2(x + y) \cdot \frac{x^2 + y^2}{\sqrt{x^2 + y^2}} = 2(x + y)\sqrt{x^2 + y^2} = 2u$$

Conclusion: The relation is verified. ■

Problem 1b: Finding Extrema

Solution. Given: $z = (x + y)^2 - \frac{x^4}{2} - \frac{y^4}{2}$
Step 1: Find critical points

$$\frac{\partial z}{\partial x} = 2(x + y) - 2x^3 = 0$$
$$\frac{\partial z}{\partial y} = 2(x + y) - 2y^3 = 0$$

From both equations: $2(x + y) = 2x^3 = 2y^3$
This implies $x^3 = y^3$, so $x = y$.

Substituting back: $2(2x) = 2x^3 \Rightarrow 4x = 2x^3 \Rightarrow x^3 = 2x$
Thus: $x^3 - 2x = 0 \Rightarrow x(x^2 - 2) = 0$
Critical points: $(0, 0)$, $(\sqrt{2}, \sqrt{2})$, $(-\sqrt{2}, -\sqrt{2})$
Step 2: Second partial derivatives

$$\frac{\partial^2 z}{\partial x^2} = 2 - 6x^2, \quad \frac{\partial^2 z}{\partial y^2} = 2 - 6y^2, \quad \frac{\partial^2 z}{\partial x \partial y} = 2$$

Step 3: Test critical points using Hessian
At $(0, 0)$: $D = (2)(2) - (2)^2 = 0$ (inconclusive)
At $(\sqrt{2}, \sqrt{2})$: $\frac{\partial^2 z}{\partial x^2} = 2 - 12 = -10$, $D = (-10)(-10) - 4 = 96 > 0$
Since $\frac{\partial^2 z}{\partial x^2} < 0$, this is a **local maximum**: $z = 8 - 4 = 4$
At $(-\sqrt{2}, -\sqrt{2})$: By symmetry, also a **local maximum**: $z = 4$

Problem 1c: Constrained Optimization (Lagrange Multipliers)

Solution. Given: $z = 20x^{1/4}y^{3/4}$, constraint: $x + 3y = 8$, $x, y > 0$
Method: Lagrange Multipliers

$$\nabla z = \lambda \nabla g, \text{ where } g = x + 3y - 8$$

$$\frac{\partial z}{\partial x} = 5x^{-3/4}y^{3/4} = \lambda$$
$$\frac{\partial z}{\partial y} = 15x^{1/4}y^{-1/4} = 3\lambda$$

From the second equation: $\lambda = 5x^{1/4}y^{-1/4}$
Equating: $5x^{-3/4}y^{3/4} = 5x^{1/4}y^{-1/4}$

$$x^{-3/4}y^{3/4} = x^{1/4}y^{-1/4} \Rightarrow y = x$$

Wait, let me recalculate: From $5x^{-3/4}y^{3/4} = 5x^{1/4}y^{-1/4}$:

$$\frac{y^{3/4}}{x^{3/4}} = \frac{y^{-1/4}}{x^{-1/4}} \Rightarrow \left(\frac{y}{x}\right)^{3/4} = \left(\frac{x}{y}\right)^{1/4}$$

$$\left(\frac{y}{x}\right)^{3/4} \cdot \left(\frac{y}{x}\right)^{1/4} = 1 \Rightarrow \left(\frac{y}{x}\right) = 1 \Rightarrow y = x$$

But from constraint $x + 3x = 8 \Rightarrow x = 2, y = 2$
Hmm, let me recalculate using the ratios properly:
From $5x^{-3/4}y^{3/4} = \lambda$ and $15x^{1/4}y^{-1/4} = 3\lambda$:

$$\frac{5x^{-3/4}y^{3/4}}{15x^{1/4}y^{-1/4}} = \frac{1}{3}$$

$$\frac{5y}{15x} = \frac{1}{3} \Rightarrow \frac{y}{3x} = \frac{1}{3} \Rightarrow y = x$$

From constraint: $x + 3x = 8 \Rightarrow x = 2$
But this should give $2 + 6 = 8$, which checks out.
Actually, let me recalculate the ratio: $\frac{1}{3} \cdot \frac{y}{x} = \frac{1}{3}$, so $y = x$.
From $x + 3x = 8$: $4x = 8 \Rightarrow x = 2, y = 2$. But $2 + 3(2) = 8$? No, $2 + 6 = 8$

Actually, $y = x$ gives $x + 3x = 4x = 8$, so $x = 2, y = 2$, but then $x + 3y = 2 + 6 = 8$
Let me recalculate: If $y = x$, then $x + 3x = 8$, so $x = 2$ and we need $y = 2/3$.
Wait, I made an error. Let me recalculate the condition from Lagrange:
$5x^{-3/4}y^{3/4} = \lambda$ and $15x^{1/4}y^{-1/4} = 3\lambda$
So: $15x^{1/4}y^{-1/4} = 3 \cdot 5x^{-3/4}y^{3/4}$
$15x^{1/4}y^{-1/4} = 15x^{-3/4}y^{3/4}$
$x^{1/4}y^{-1/4} = x^{-3/4}y^{3/4}$
$x^{1/4+3/4} = y^{3/4+1/4}$
$x = y$
But $x + 3y = 8$ gives $x + 3x = 8$, so $x = 2, y = 2$.
Check: $2 + 3(2) = 8$
Maximum value: $z = 20(2)^{1/4}(2)^{3/4} = 20 \cdot 2 = 40$
Answer: Maximum at $(2, 2)$ with $z_{\max} = 40$

Problem 2a: Double Integral in Changed Variables

Solution. Region D is bounded by $y = 1/x$, $y = 5/x$, $x = y^2$, $x = 5y^2$
Use substitution: $u = xy$, $v = x/y^2$
For the boundaries: - $y = 1/x$ gives $u = 1$ - $y = 5/x$ gives $u = 5$ - $x = y^2$ gives $v = 1$ - $x = 5y^2$ gives $v = 5$
The Jacobian: Using $x = \sqrt{uv}$, $y = \sqrt{u/v}$:

$$\left|\frac{\partial(x, y)}{\partial(u, v)}\right| = \frac{1}{2v}$$

$$\text{Area} = \int_1^5 \int_1^5 \frac{1}{2v}\, du\, dv = \int_1^5 \frac{4}{2v}\, dv = 2\ln(5)$$

Answer: Area $= 2\ln(5)$

Problem 2b: Population Calculation

Solution. Population density: $f(x, y) = 20000e^{-(x^2+y^2)/5}$
Total population in radius 5 km:

$$P = \int\int_D 20000e^{-(x^2+y^2)/5} dA$$

Converting to polar coordinates: $x = r\cos\theta$, $y = r\sin\theta$, $0 \le r \le 5$, $0 \le \theta \le 2\pi$

$$P = \int_0^{2\pi} \int_0^5 20000e^{-r^2/5} r\, dr\, d\theta$$

Let $u = -r^2/5$, $du = -2r/5dr$:

$$\int_0^5 e^{-r^2/5} r\, dr = -\frac{5}{2}[e^{-r^2/5}]_0^5 = -\frac{5}{2}(e^{-5} - 1) = \frac{5}{2}(1 - e^{-5})$$

$$P = 20000 \cdot 2\pi \cdot \frac{5}{2}(1 - e^{-5}) = 100000\pi(1 - e^{-5}) \approx 310,844 \text{ people}$$

Average density: $\bar{f} = \frac{P}{\pi \cdot 5^2} = \frac{100000\pi(1-e^{-5})}{25\pi} = 4000(1 - e^{-5}) \approx 3,942$ people/km^2

Problem 3: Mass Calculation

Solution. Object: $\Omega = \{(x, y, z) : \sqrt{x^2 + y^2} \leq z \leq 4 - \sqrt{x^2 + y^2}\}$
Density: $\rho(x, y, z) = x^2 + y^2$
In cylindrical coordinates (r, θ, z): $\rho = r^2$
For each r, z ranges from r to $4 - r$ (valid for $0 \leq r \leq 2$)

$$m = \int_0^{2\pi} \int_0^2 \int_r^{4-r} r^2 \cdot r \, dz \, dr \, d\theta$$

$$= \int_0^{2\pi} \int_0^2 r^3(4 - 2r) \, dr \, d\theta$$

$$= 2\pi \int_0^2 (4r^3 - 2r^4) \, dr = 2\pi \left[r^4 - \frac{2r^5}{5} \right]_0^2$$

$$= 2\pi \left(16 - \frac{64}{5} \right) = 2\pi \cdot \frac{16}{5} = \frac{32\pi}{5}$$

Answer: $m = \frac{32\pi}{5}$

Problem 4: Line Integral (Green's Theorem)

Solution.

$$I = \int_\gamma (5y - 6^x)dx + (10x + 6^y)dy$$

Using Green's Theorem with γ being circle $x^2 + y^2 = 36$ (counterclockwise):

$$I = \iint_D \left(\frac{\partial(10x + 6^y)}{\partial x} - \frac{\partial(5y - 6^x)}{\partial y} \right) dA$$

$$= \iint_D (10 - 5)dA = 5 \iint_D dA$$

$$= 5 \cdot \text{Area of circle} = 5 \cdot 36\pi = 180\pi$$

Answer: $I = 180\pi$

* Solutions: Exam 2 - Abstract Algebra

Problem 1a: Proving $(\mathbb{Z}, *)$ is a Group

Solution. Given: $a * b = a + b + 2026$ for all $a, b \in \mathbb{Z}$
We need to verify:

1. **Closure:** For all $a, b \in \mathbb{Z}$, $a * b = a + b + 2026 \in \mathbb{Z}$
2. **Associativity:**

$$\begin{aligned}(a * b) * c &= (a + b + 2026) * c \\ &= (a + b + 2026) + c + 2026 \\ &= a + b + c + 2 \cdot 2026\end{aligned}$$

$$\begin{aligned}a * (b * c) &= a * (b + c + 2026) \\ &= a + (b + c + 2026) + 2026 \\ &= a + b + c + 2 \cdot 2026\end{aligned}$$

   So $(a * b) * c = a * (b * c)$

3. **Identity element:** We need e such that $a * e = a$ for all $a \in \mathbb{Z}$
   $a * e = a + e + 2026 = a$
   Thus: $e = -2026$
   Check: $a * (-2026) = a + (-2026) + 2026 = a$
4. **Inverse element:** For each $a \in \mathbb{Z}$, we need $a' \in \mathbb{Z}$ such that $a * a' = e = -2026$
   $a + a' + 2026 = -2026$
   Thus: $a' = -4052 - a \in \mathbb{Z}$
   Check: $a * (-4052 - a) = a + (-4052 - a) + 2026 = -2026$

Conclusion: $(\mathbb{Z}, *)$ satisfies all group axioms, so it is a group.

Problem 1b: Is $X = \{4k + 2 | k \in \mathbb{Z}\}$ a Subgroup?

Solution. X is the set of all even integers of the form $4k + 2$ (i.e., 2, 6, 10, -2, -6, ...).
For X to be a subgroup, we need:

1. $X \neq \emptyset$ (clearly true)
2. For $a, b \in X$, the inverse $a' \in X$ and $a * a' \in X$ (subgroup criterion)

Check identity element: The identity is $e = -2026$
Is $-2026 \in X$? We need $-2026 = 4k + 2$ for some $k \in \mathbb{Z}$
$-2026 = 4k + 2 \Rightarrow 4k = -2028 \Rightarrow k = -507$
Yes! $-2026 = 4(-507) + 2 \in X$
Check closure: Take $a = 2, b = 6 \in X$

$a * b = 2 + 6 + 2026 = 2034 = 4(508) + 2 \in X$
Check inverses: For $a = 2$, the inverse is $a' = -4052 - 2 = -4054 = 4(-1014) + 2 \in X$
Actually, let me verify more generally: If $a = 4k + 2$, then

$$a' = -4052 - a = -4052 - (4k + 2) = -4054 - 4k = 4(-1013.5 - k)$$

Wait, $-4054 = 4(-1013.5)$, which is not an integer coefficient. Let me recalculate:
$-4054/4 = -1013.5$, so $a' = -4054 - 4k$ doesn't have the form $4m + 2$.
Let me verify: $-4054 = 4(-1014) + 2$? $4(-1014) + 2 = -4056 + 2 = -4054$
So $a' = 4(-1014) - 4k = 4(-1014 - k) + 2 \in X$
Conclusion: X is a subgroup of $(\mathbb{Z}, *)$

Problem 2: Group Homomorphism

Solution. Given: $\varphi : X \to Y; x^l \mapsto (y^k)^l$ where X is cyclic order m, Y is cyclic order n
Hypothesis: $km \equiv 0 \pmod{n}$ (i.e., $n|km$)
We need to prove φ is a homomorphism: $\varphi(x^a \cdot x^b) = \varphi(x^a) \cdot \varphi(x^b)$
Verification:
In X: $x^a \cdot x^b = x^{a+b}$ (multiplicatively)

$$\varphi(x^{a+b}) = (y^k)^{a+b} = y^{k(a+b)}$$

$$\varphi(x^a) \cdot \varphi(x^b) = (y^k)^a \cdot (y^k)^b = y^{ka} \cdot y^{kb} = y^{k(a+b)}$$

So $\varphi(x^{a+b}) = \varphi(x^a) \cdot \varphi(x^b)$
Well-definedness: We need to ensure the mapping is well-defined in Y.
For φ to be well-defined, if $x^l = x^{l'}$ in X, then $(y^k)^l = (y^k)^{l'}$ in Y.
$x^l = x^{l'}$ in X means $l \equiv l' \pmod{m}$
$(y^k)^l = (y^k)^{l'}$ in Y means $kl \equiv kl' \pmod{n}$
Given $n|km$, we have $kl \equiv kl' \pmod{n}$ whenever $l \equiv l' \pmod{m}$
Conclusion: φ is a group homomorphism.

Problem 3a: $\mathbb{Z}(\sqrt{2})$ is a Ring

Solution. $\mathbb{Z}(\sqrt{2}) = \{a + b\sqrt{2} | a, b \in \mathbb{Z}\}$ with standard real addition and multiplication.
Verification of ring axioms:

1. **Closure under addition:** $(a_1 + b_1\sqrt{2}) + (a_2 + b_2\sqrt{2}) = (a_1 + a_2) + (b_1 + b_2)\sqrt{2} \in \mathbb{Z}(\sqrt{2})$
2. **Additive identity:** $0 = 0 + 0\sqrt{2} \in \mathbb{Z}(\sqrt{2})$
3. **Additive inverses:** $-(a + b\sqrt{2}) = (-a) + (-b)\sqrt{2} \in \mathbb{Z}(\sqrt{2})$
4. **Associativity of addition:** Inherited from $\mathbb{R}$
5. **Commutativity of addition:** Inherited from $\mathbb{R}$
6. **Closure under multiplication:** $(a_1+b_1\sqrt{2})(a_2+b_2\sqrt{2}) = a_1a_2+2b_1b_2+(a_1b_2+a_2b_1)\sqrt{2} \in \mathbb{Z}(\sqrt{2})$
7. **Multiplicative identity:** $1 = 1 + 0\sqrt{2} \in \mathbb{Z}(\sqrt{2})$

8. **Associativity of multiplication:** Inherited from $\mathbb{R}$
9. **Distributivity:** Inherited from $\mathbb{R}$
10. **Commutativity of multiplication:** Inherited from $\mathbb{R}$

Conclusion: $\mathbb{Z}(\sqrt{2})$ is a commutative ring with unity.

Problem 3b: Is $\mathbb{Z}(\sqrt{2})$ a Field?

Solution. For $\mathbb{Z}(\sqrt{2})$ to be a field, every nonzero element must have a multiplicative inverse in $\mathbb{Z}(\sqrt{2})$.

Counterexample: Consider $a = 2 \in \mathbb{Z}(\sqrt{2})$

The multiplicative inverse of 2 would be $2^{-1} = \frac{1}{2}$

Is $\frac{1}{2} \in \mathbb{Z}(\sqrt{2})$? We need integers p, q such that:

$$\frac{1}{2} = p + q\sqrt{2}$$

This implies $1 = 2p + 2q\sqrt{2}$

Comparing rational and irrational parts: - Rational: $2p = 1 \Rightarrow p = 1/2 \notin \mathbb{Z}$ - Irrational: $2q = 0 \Rightarrow q = 0$

This is a contradiction, so $2^{-1} \notin \mathbb{Z}(\sqrt{2})$.

Conclusion: $\mathbb{Z}(\sqrt{2})$ is NOT a field. However, it is an integral domain (as it's a subring of $\mathbb{R}$).

Problem 4: Field, Integral Domain, and Properties

Solution. a) Definitions:

Field: A commutative ring F with unity $1 \neq 0$ where every nonzero element has a multiplicative inverse.

Integral Domain: A commutative ring D with unity $1 \neq 0$ with no zero divisors (i.e., $ab = 0 \Rightarrow a = 0$ or $b = 0$).

b) Every field is an integral domain:

Let F be a field. Suppose $ab = 0$ for $a, b \in F$.

If $a \neq 0$, then a^{-1} exists. Thus:

$$b = a^{-1}(ab) = a^{-1} \cdot 0 = 0$$

So no zero divisors exist. Hence F is an integral domain.

c) Is $\mathbb{Z}^n$ $(n > 1)$ an integral domain?

No. $\mathbb{Z}^n$ has zero divisors.

Counterexample: In $\mathbb{Z}^2$, let $a = (1, 0)$ and $b = (0, 1)$.

Both $a, b \neq (0, 0)$, but $ab = (1 \cdot 0, 0 \cdot 1) = (0, 0)$.

Hence $\mathbb{Z}^2$ is not an integral domain.

Problem 5a: Eisenstein's Criterion

Solution. Polynomial: $f(x) = x^3 - 3x + 1 \in \mathbb{Q}[x]$

Eisenstein's Criterion: If for prime p:

1. $p | a_i$ for all $i < n$ (all non-leading coefficients)

2. $p \nmid a_n$ (leading coefficient)

3. $p^2 \nmid a_0$ (constant term)

Then $f(x)$ is irreducible over $\mathbb{Q}$.

Try $p = 3$: - Coefficients: $1, 0, -3, 1$ - $3|0, 3|(-3)$ (non-leading coefficients) - $3 \nmid 1$ (leading coefficient) - $3^2 = 9 \nmid 1$ (constant term)

Conclusion: $f(x) = x^3 - 3x + 1$ is irreducible in $\mathbb{Q}[x]$ by Eisenstein's criterion with $p = 3$.

Problem 5b: Polynomial Division in $\mathbb{Z}_7[x]$

Solution. $f = x^3 + \overline{p}x + \overline{5}$ and $g = x^2 + \overline{5}x + \overline{6}$ in $\mathbb{Z}_7[x]$

For $g|f$, we need $f = gq + r$ where $\deg(r) < 2$.

Divide: $f = g(x - 5) + (ax + b)$

$$x^3 + \overline{p}x + \overline{5} = (x^2 + \overline{5}x + \overline{6})(x - \overline{5}) + ax + b$$

Expand RHS:

$$(x^2 + \overline{5}x + \overline{6})(x - \overline{5}) = x^3 - \overline{5}x^2 + \overline{5}x^2 - \overline{25}x + \overline{6}x - \overline{30}$$

$$= x^3 + (\overline{6} - \overline{25})x - \overline{30}$$

In $\mathbb{Z}_7$: $-25 \equiv -25 + 28 = 3 \pmod 7$ and $-30 \equiv -30 + 35 = 5 \pmod 7$

$$= x^3 + (\overline{6} + \overline{3})x + \overline{5} = x^3 + \overline{2}x + \overline{5}$$

For $g|f$, we need remainder $= 0$:

$$x^3 + \overline{p}x + \overline{5} = x^3 + \overline{2}x + \overline{5}$$

Thus: $\overline{p} = \overline{2}$, so $\boxed{p \equiv 2 \pmod 7}$

* Solutions: Exam 3 - Functional Analysis

Problem 1a: Proving $\|\cdot\|$ is a Norm

Solution. Given: $\|(x,y)\| = 2|x| + |y|$ on $\mathbb{R}^2$

We verify the norm axioms:

1) Positive Definiteness:

$$\|(x,y)\| = 2|x| + |y| \geq 0$$

$\|(x,y)\| = 0 \Leftrightarrow 2|x| + |y| = 0 \Leftrightarrow |x| = 0$ and $|y| = 0 \Leftrightarrow (x,y) = (0,0)$

2) Homogeneity: For $\lambda \in \mathbb{R}$:

$$\|(\lambda x, \lambda y)\| = 2|\lambda x| + |\lambda y| = 2|\lambda||x| + |\lambda||y|$$
$$= |\lambda|(2|x| + |y|) = |\lambda| \cdot \|(x,y)\|$$

3) Triangle Inequality: For $(x_1,y_1),(x_2,y_2) \in \mathbb{R}^2$:

$$\|(x_1+x_2, y_1+y_2)\| = 2|x_1+x_2| + |y_1+y_2|$$
$$\leq 2(|x_1| + |x_2|) + (|y_1| + |y_2|)$$
$$= (2|x_1| + |y_1|) + (2|x_2| + |y_2|)$$
$$= \|(x_1,y_1)\| + \|(x_2,y_2)\|$$

Conclusion: $\|\cdot\|$ is a norm on $\mathbb{R}^2$.

Problem 1b: Unit Ball Visualization

Solution. The closed unit ball is:

$$\overline{B(0,1)} = \{(x,y) : 2|x| + |y| \leq 1\}$$

This describes a rhombus (diamond shape) with vertices: - When $y = 0$: $2|x| \leq 1 \Rightarrow x \in [-1/2, 1/2]$, vertices at $(\pm 1/2, 0)$ - When $x = 0$: $|y| \leq 1 \Rightarrow y \in [-1,1]$, vertices at $(0, \pm 1)$

Vertices of the unit ball:

$$(1/2, 0), \quad (0,1), \quad (-1/2, 0), \quad (0,-1)$$

Edges: - Upper right: $x \geq 0, y \geq 0$: $2x + y = 1$ (line from $(1/2,0)$ to $(0,1)$) - Upper left: $x \leq 0, y \geq 0$: $-2x + y = 1$ (line from $(0,1)$ to $(-1/2,0)$) - Lower left: $x \leq 0, y \leq 0$: $-2x - y = 1$ (line from $(-1/2,0)$ to $(0,-1)$) - Lower right: $x \geq 0, y \leq 0$: $2x - y = 1$ (line from $(0,-1)$ to $(1/2,0)$)

The unit ball is a rhombus centered at the origin with: - Horizontal axis semi-length: $1/2$ - Vertical axis semi-length: 1

Diagram:

$$(0,1)$$
$$(-1/2,0)$$

$$(1/2,0)$$

$$(0,-1)$$

(Connected by straight line segments forming a rhombus)

Problem 2a: Continuity of Linear Map

Solution. Given: $T : C([0,1]) \to C([0,1])$ defined by $(Tf)(x) = x \int_0^1 y^2 f(y)dy$

We prove T is linear and continuous.

Linearity: For $f, g \in X$ and $\alpha, \beta \in \mathbb{R}$:

$$T(\alpha f + \beta g)(x) = x \int_0^1 y^2(\alpha f(y) + \beta g(y))dy$$

$$= \alpha x \int_0^1 y^2 f(y)dy + \beta x \int_0^1 y^2 g(y)dy$$

$$= \alpha(Tf)(x) + \beta(Tg)(x)$$

So $T(\alpha f + \beta g) = \alpha Tf + \beta Tg$.

Continuity: For $f \in X$:

$$|(Tf)(x)| = \left| x \int_0^1 y^2 f(y)dy \right| \leq |x| \cdot \left| \int_0^1 y^2 f(y)dy \right|$$

$$\leq |x| \int_0^1 y^2 |f(y)|dy \leq |x| \cdot 1 \cdot \|f\|_\infty$$

Thus:

$$\|Tf\|_\infty = \max_{x\in[0,1]} |(Tf)(x)| \leq \|f\|_\infty$$

So $\|Tf\| \leq \|f\|$, and T is continuous.

Problem 2b: Operator Norm

Solution. We need to find:

$$\|T\|_{B(X,X)} = \sup_{\|f\|\leq 1} \|Tf\|$$

From above, $\|Tf\| \leq \|f\|$, so $\|T\|_{B(X,X)} \leq 1$.

To show the bound is tight, consider $f(x) = 1$ (constant function):

$$\|f\| = 1$$

$$(Tf)(x) = x \int_0^1 y^2 \cdot 1\, dy = x \cdot \frac{1}{3} = \frac{x}{3}$$

$$\|Tf\|_\infty = \max_{x\in[0,1]} \frac{x}{3} = \frac{1}{3}$$

Now try $f(x) = x$:

$$(Tf)(x) = x \int_0^1 y^2 \cdot y\, dy = x \int_0^1 y^3 dy = x \cdot \frac{1}{4} = \frac{x}{4}$$

$$\|Tf\|_\infty = \frac{1}{4}$$

Actually, let me reconsider. For general f:

$$\|Tf\|_\infty = \max_{x\in[0,1]} \left| x \int_0^1 y^2 f(y)dy \right| = \left| \int_0^1 y^2 f(y)dy \right| \cdot \max_{x\in[0,1]} |x|$$

$$= \left| \int_0^1 y^2 f(y)dy \right| \cdot 1 = \left| \int_0^1 y^2 f(y)dy \right|$$

By Cauchy-Schwarz (or directly):

$$\left| \int_0^1 y^2 f(y)dy \right| \leq \int_0^1 y^2 |f(y)|dy \leq \|f\|_\infty \int_0^1 y^2 dy = \frac{1}{3}\|f\|_\infty$$

The maximum is approached when $f(y) = \text{sign}(y^2 f(y))$ with $|f| = 1$, giving:

$$\|Tf\|_\infty = \frac{1}{3}$$

Answer: $\boxed{\|T\|_{B(X,X)} = \frac{1}{3}}$

Problem 3a: Continuity of Functional

Solution. Given: $M = \{(x_1, x_2, x_3, x_4) : x_1 = x_2, x_2 = 2x_3, x_3 = -x_4\}$
Parametrization: $x_1 = t, x_2 = t, x_3 = t/2, x_4 = -t/2$ for $t \in \mathbb{R}$
So $M = \{(t, t, t/2, -t/2) : t \in \mathbb{R}\}$
Functional: $f(x) = x_1 + x_2 - x_3 + 2x_4 = t + t - \frac{t}{2} + 2(-\frac{t}{2}) = 2t - \frac{t}{2} - t = \frac{t}{2}$
Linearity: For $x, y \in M$ with parameters t_x, t_y and $\alpha, \beta \in \mathbb{R}$:

$$f(\alpha x + \beta y) = \frac{\alpha t_x + \beta t_y}{2} = \alpha f(x) + \beta f(y)$$

Continuity:

$$|f(x)| = \left| \frac{t}{2} \right| = \frac{|t|}{2}$$

The norm on M:

$$\|x\|^2 = t^2 + t^2 + (t/2)^2 + (t/2)^2 = 2t^2 + \frac{t^2}{2} = \frac{5t^2}{2}$$

$$\|x\| = |t|\sqrt{\frac{5}{2}}$$

Thus: $|f(x)| = \frac{|t|}{2} = \frac{1}{2\sqrt{5/2}}\|x\| = \frac{1}{\sqrt{10}}\|x\|$
So $|f(x)| \leq \frac{1}{\sqrt{10}}\|x\|$, proving continuity.

Problem 3b: Hahn-Banach Extension

Solution. By Hahn-Banach extension theorem, there exists $F : \mathbb{R}^4 \to \mathbb{R}$ such that: - $F|_M = f$ - $\|F\|_{B(\mathbb{R}^4)} = \|f\|_{B(M)}$

From Problem 3a: $\|f\|_{B(M)} = \frac{1}{\sqrt{10}}$

Finding F: Since F is linear functional on $\mathbb{R}^4$:

$$F(x_1, x_2, x_3, x_4) = ax_1 + bx_2 + cx_3 + dx_4$$

On M: $(t, t, t/2, -t/2)$

$$f(t, t, t/2, -t/2) = at + bt + \frac{ct}{2} - \frac{dt}{2} = \frac{t}{2}$$

So: $a + b + \frac{c}{2} - \frac{d}{2} = \frac{1}{2}$

Extremal functional (norm preservation):

We want to minimize $\|F\| = \sqrt{a^2 + b^2 + c^2 + d^2}$ subject to constraint.

By Lagrange multipliers and orthogonality to M, the optimal extension is:

$F(x_1, x_2, x_3, x_4) = \frac{2}{5}(x_1 + x_2 - x_3 + 2x_4)$

Verification: On M: $F(t, t, t/2, -t/2) = \frac{2}{5}(t + t - t/2 - t) = \frac{2}{5} \cdot \frac{t}{2} = \frac{t}{5}$

Hmm, this doesn't match. Let me recalculate more carefully using the orthogonal complement.

The normal vector to M is proportional to constraints' gradients. The extremal extension is:

$$\boxed{F(x_1, x_2, x_3, x_4) = \frac{1}{\sqrt{10}}(x_1 + x_2 - x_3 + 2x_4)}$$

With $\|F\| = \frac{1}{\sqrt{10}}$

Problem 4a: Orthogonal Subspaces

Solution. $M_e = \{f \in L^2([-1, 1]) : f(-x) = f(x)\}$ (even functions)

$M_o = \{f \in L^2([-1, 1]) : f(-x) = -f(x)\}$ (odd functions)

Subspace property: - M_e and M_o are closed under addition and scalar multiplication - Both contain the zero function

Orthogonality: For $g \in M_e$ and $h \in M_o$:

$$\langle g, h\rangle = \int_{-1}^{1} g(x)h(x)dx$$

Substitute $x \to -x$:

$$= \int_{-1}^{1} g(-x)h(-x)\frac{d(-x)}{dx}dx = \int_{-1}^{1} g(-x)h(-x)(-1)dx$$

$$= -\int_{-1}^{1} g(-x)h(-x)dx = -\int_{-1}^{1} g(x)(-h(x))dx$$

$$= \int_{-1}^{1} g(x)h(x)dx = \langle g, h\rangle$$

So $2\langle g, h\rangle = \langle g, h\rangle$, which implies $\langle g, h\rangle = 0$

Problem 4b: Projection and Distance

Solution. $f(x) = x^3 + 3x^2 - 2x + 1$

Decompose: $f(x) = f_e(x) + f_o(x)$ where: - $f_e(x) = \frac{f(x)+f(-x)}{2}$ - $f_o(x) = \frac{f(x)-f(-x)}{2}$

Calculate:

$$f(-x) = -x^3 + 3x^2 + 2x + 1$$

$$f_e(x) = \frac{(x^3 + 3x^2 - 2x + 1) + (-x^3 + 3x^2 + 2x + 1)}{2} = \frac{6x^2 + 2}{2} = 3x^2 + 1$$

$$f_o(x) = \frac{(x^3 + 3x^2 - 2x + 1) - (-x^3 + 3x^2 + 2x + 1)}{2} = \frac{2x^3 - 4x}{2} = x^3 - 2x$$

The orthogonal projection of f onto M_o is $f_o(x) = x^3 - 2x$.

Distance:

$$d(f, M_o) = \|f - f_o\| = \|f_e\|$$

$$\|f_e\|^2 = \int_{-1}^{1} (3x^2 + 1)^2 dx = \int_{-1}^{1} (9x^4 + 6x^2 + 1) dx$$

$$= \left[9 \cdot \frac{x^5}{5} + 6 \cdot \frac{x^3}{3} + x\right]_{-1}^{1}$$

$$= 2\left(\frac{9}{5} + 2 + 1\right) = 2 \cdot \frac{9 + 10 + 5}{5} = 2 \cdot \frac{24}{5} = \frac{48}{5}$$

$$d(f, M_o) = \|f_e\| = \sqrt{\frac{48}{5}} = \frac{4\sqrt{3}}{\sqrt{5}} = \frac{4\sqrt{15}}{5}$$

Answer: - Orthogonal projection: $\boxed{x^3 - 2x}$ - Distance: $\boxed{\frac{4\sqrt{15}}{5}}$
